

## AMENDMENTS TO THE CLAIMS

### Listing of Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently amended) A method comprising:

creating a rule-based grammar having a wildcard identifier in place of a predefined category of words;

defining rules to produce artificial combinations of unique sounds in a language, where each artificial combination represents a pronunciation of the words in the predefined category, and represents a generic word that is defined in a speech engine's vocabulary database;

generating a set of artificial combinations of unique sounds by substituting the wildcard identifier with the rules; and

in response to human speech specifying a wildcard word, determining a ~~number~~ set of potential words spoken by the user by finding the generic words and non-generic words that phonetically match the wildcard word, wherein the non-generic words are not part of the rule-based grammar, and then assigning each of the generic and non-generic words a confidence level based on a set of rules followed by the speech engine, removing the generic words from the set of potential words spoken by the user, and selecting a remaining word from the set of potential words spoken by the user having a highest confidence level.

2. (Original) The method of claim 1, wherein the rule-based grammar comprises a context-free grammar (CFG).

3. (Currently Amended) The method of claim 1, ~~additionally comprising selecting a non-generic word having the highest confidence level~~ wherein the remaining word is a non-generic word.

4. (Original) The method of claim 1, wherein a unique sound in a language comprises a phoneme.

5. (Original) The method of claim 1, wherein said generating a set of artificial combinations of unique sounds by substituting the wildcard identifier with the rules comprises converting the wildcard rule-based grammar into a standard rule-based grammar.

6. (Currently Amended) A method comprising:

specifying a wildcard context-free grammar (CFG) which includes a wildcard identifier in place of a predefined category of words, each of which are defined in the speech engine's vocabulary database;

specifying a set of rules that define artificial combinations of unique sounds in a language, where each artificial combination represents a pronunciation of the words in the predefined category, and corresponds to a generic word that is defined in a speech engine's vocabulary database;

converting the wildcard CFG file into a recognized CFG grammar file by generating a set of artificial combinations of unique sounds based on the rules; and

in response to human speech having one or more spoken units, generating a results object having a number of generic words corresponding to artificial combinations appropriate to a given spoken unit, and having a number of non-generic words in the speech engine's vocabulary database appropriate to a given spoken unit, wherein the non-generic words are not part of the CFG, each generic word and non-generic word having an associated confidence level based on a set of rules followed by the speech engine, removing the generic words from the results object, and selecting a remaining word from the results object having a highest confidence level.

7. (Original) The method of claim 6, additionally comprising querying the results object for a word having the highest confidence level in the speech engine's vocabulary database.

8. (Original) The method of claim 6, wherein a unique sound in a language comprises a phoneme.

9. (Currently Amended) A machine-readable medium having stored thereon data representing sequences of instructions, the sequences of instructions which, when executed by a processor, cause the processor to perform the following:

create a rule-based grammar having a wildcard identifier in place of a predefined category of words;

define rules to produce artificial combinations of unique sounds in a language, where each artificial combination represents a pronunciation of the words in the predefined category, and represents a generic word that is defined in a speech engine's vocabulary database;

generate a set of artificial combinations of unique sounds by substituting the wildcard identifier with the rules; and

in response to human speech specifying a wildcard word, determine a ~~number~~ set of potential words spoken by the user by finding the generic words and non-generic words that phonetically match the wildcard word, wherein the non-generic words are not part of the rule-based grammar, and then assigning each of the generic and non-generic words a confidence level based on a set of rules followed by the speech engine, removing the generic words from the set of potential words spoken by the user, and selecting a remaining word from the set of potential words spoken by the user having a highest confidence level.

10. (Original) The machine-readable medium of claim 9, wherein the rule-based grammar comprises a context-free grammar (CFG).

11. (Original) The machine-readable medium of claim 9, wherein a unique sound in a language comprises a phoneme.

12. (Original) An apparatus comprising: at least one processor; and a machine-readable medium having instructions encoded thereon, which when executed by the processor, are capable of directing the processor to:

create a rule-based grammar having a wildcard identifier in place of a predefined category of words;

define rules to produce artificial combinations of unique sounds in a language, where each artificial combination represents a pronunciation of the words in the predefined category, and represents a generic word that is defined in a speech engine's vocabulary database;

generate a set of artificial combinations of unique sounds by substituting the wildcard identifier with the rules; and

in response to human speech specifying a wildcard word, determine a ~~number~~ set of potential words spoken by the user by finding the generic words and non-generic words that phonetically match the wildcard word, wherein the non-generic words are not part of the rule-based grammar, and then assigning each of the generic and non-generic words a confidence level based on a set of rules followed by the speech engine, removing the generic words from the set of potential words spoken by the user, and selecting a remaining word from the set of potential words spoken by the user having a highest confidence level.

13. (Original) The apparatus of claim 12, wherein the rule-based grammar comprises a context-free grammar (CFG).

14. (Original) The apparatus of claim 12, wherein a unique sound in a language comprises a phoneme.

15. (Currently Amended) An apparatus comprising:

means for creating a rule-based grammar having a wildcard identifier in place of a predefined category of words;

means for defining rules to produce artificial combinations of unique sounds in a language, where each artificial combination represents a pronunciation of the words in the predefined category, and represents a generic word that is defined in a speech engine's vocabulary database;

means for generating a set of artificial combinations of unique sounds by substituting the wildcard identifier with the rules; and

in response to human speech specifying a wildcard word, means for determining a ~~number~~ set of potential words spoken by the user by finding the generic words and non-generic words that phonetically match the wildcard word, wherein the non-generic words are not part of the rule-based grammar, and then assigning each of the generic and non-generic words a confidence level based on a set of rules followed by the speech engine, removing the generic words from the set of potential words spoken by the user, and selecting a remaining word from the set of potential words spoken by the user having a highest confidence level.

16. (Original) The apparatus of claim 15, wherein the rule-based grammar comprises a context-free grammar (CFG).

17. (Original) The apparatus of claim 15, wherein a unique sound in a language comprises a phoneme.

18. (Currently amended) A system comprising:

a conversion module to accept a wildcard rule-based grammar file as input, wherein the rule-based grammar has a wildcard identifier in place of a predefined category of words, wherein the rule-based grammar defines rules to produce artificial combinations of unique sounds in a language, and to convert the wildcard rule-based grammar file to a set of artificial combinations of unique sounds in a language by substituting the wildcard identifier with the rules;

a speech engine to accept human speech having a wildcard word as input, and to determine a ~~number~~ set of potential words matching the wildcard word, the set of potential words comprising a number of generic words and non-generic words corresponding to the artificial combinations of unique sounds in a language, ~~and a number of non-generic words~~ wherein the non-generic words are not part of the rule-based grammar; and

a speech adapter to interact with the speech engine by querying the speech engine for potential words matching the wildcard word, wherein each of the generic and non-generic words are assigned a confidence level based on a set of rules followed by the speech engine, wherein the generic words are removed from the set of potential words, wherein a remaining word from the set of potential words having a highest confidence level is selected, and by returning the selected word which is most likely to match the wildcard word spoken by the user.

19. (Original) The system of claim 18, wherein the unique sounds in a language comprise phonemes.

20. (Original) The system of claim 18, wherein the rule-based grammar is a context-free grammar (CFG).

21. (Original) The system of claim 18, wherein the speech engine comprises the conversion module.
